**Abstract**

The aim of the study was to assess the effect of drinking rooibos tea (*Aspalathus linearis*) on total antioxidant capacity (TAC), lipid triacylglycerols, cholesterol and glycaemia plasma levels in humans. *In vitro*, unfermented rooibos tea displayed a 28% higher value of TRAP than did the fermented beverage. An acute intervention study, cross-over design, was performed, with 15 healthy volunteers who consumed 500 ml of either water, unfermented or fermented rooibos teas. **Plasma antioxidant capacity increased significantly with both teas**, reaching a peak at 1 h post-consumption (+6.6%, *p* < 0.05 fermented tea; +2.9%, *p* < 0.01 unfermented tea). No changes in triacylglycerols, cholesterol or uric acid were observed with any of the treatments. A transitory increase in glycaemia at 30 min was linked to glucose upload. **The data show that rooibos teas represent a source of dietary antioxidants in humans.**
